

Guide last updated: 2022-12-31

A few things to note before we begin

- This guide is for **non-rooted devices** but should still work fine on rooted devices
- Perform all of these steps from your phone
- If you already have Vanced installed, it won't cause any conflicts and you don't need to uninstall it
- This guide is updated regularly (usually within a few days of a new manager or patch version)
- This guide is for YouTube, but the same principles apply to other supported apps ([See here for the list of supported apps](#))
- If you have downloaded a pre-built APK from a website offering them, it's not legit and may have been tampered with, so it's highly recommended to uninstall it and build your own APK using this guide
- The official website for ReVanced is <https://revancedapp.com> which redirects to the ReVanced GitHub

First time install

- [Download and install MicroG so you can log into your Google account and access your subs and watch later](#)
- [Or you can try the new MicroG from one of the ReVanced devs \(Inotia\)](#)
- Either one will work, so don't worry which one you choose
- [Download the latest ReVanced Manager APK and install it](#)
- [Open the manager and go to patcher](#)
- [Select application](#)
- [Tap on YouTube and check what the recommended version is](#)
- [Go to APK mirror for the YouTube APKs](#)
- Find the version that matches what the manager recommends
- So as of right now, it's version 17.49.37
- Go into that version
- [Under the downloads, find the option that says "APK" in grey](#)
- Download that
- **Do not select the version that says "bundle" as this is the split APK and will not work properly**
- When it's downloaded, go back to the manager and go to patcher
- [Select application then storage](#)
- [Select the YouTube APK you downloaded](#)
- Check the boxes for the patches you want (just don't select debugging - I recommend selecting all patches apart from the debugging one)
- [In this example I selected all and got a warning](#)
- [Then I searched for "deb" for "debugging" and disabled it](#)
- [Hit patch](#)
- [Wait a while](#)
- [Once it's done, hit install](#)
- Open YouTube ReVanced and log into your Google account

- Done!

Manager updates

- The manager will have a blue "update manager" button when an update is available
- Tapping this will download the update and prompt you to install it
- If this ever fails, [follow this link to the official manager APKs](#)
- Download the latest APK and install it, updating your current installed version
- This should resolve your manager issues

YouTube ReVanced updates

- OK so you're patched and up to date, now what?
- Keep checking back in the manager for updates every few days
- As this is an alpha, it's a little buggy, but over time this will improve
- For now, when you go to apply patches to your YouTube APK, make a note of the patch version displayed in the top right
- Chances are, you don't need to re-patch until there's an updated version
- So if it currently says the version is something like v2.143.0 and you patched to that, you're all good
- If you open the manager a few days later and it says something like v2.146.0 then it's probably a good idea to re-patch and update
- I believe the devs are implementing a feature at some point to show you what updates you're missing to prompt you to re-patch
- Again, this is an alpha and will improve over time

YouTube ReVanced crashes instantly when I open it

- It's likely that you downloaded and patched the wrong APK
- [Ensure you download the APK that says "APK" in grey](#)
- **Do not select the version that says "bundle" as this is the split APK and will not work properly**
- Once you've done this, uninstall your current installed YouTube ReVanced
- Then follow the above steps again to build a new APK
- If you've done all of this and it's still not working, then post a thread here or on the official Discord server for support
